## FORD TRITON SPARK PLUG THREAD REPAIR INSERT KIT

**ROT#S:**

302-00001

**Features:**

FORD TRITON SPARK PLUG THREAD REPAIR INSERT KIT

302-00001 kit for Spark Plug thread repair in Modular and Triton engines

The 302-00001 kit contains everything needed to properly install the hard-anodized full thread aluminum inserts. It includes:

- A gauge tool to easily identify which type of head you are working on (Type 1, Type 2, or Type 3)
- Piloted core drill and special piloted tap with alignment bushings
- Installation tools to screw the insert in to the correct depth
- Tooling for installing the locking pin to prevent the repair insert from backing out
- Cutting fluid and thread locker
- Height gauge to verify the insert was installed to the correct depth
- Complete step by step instructions for over-the-fender and on-the-bench installation procedures

These heads have been classified into three types that require three different sets of tooling to be able to correctly install inserts into all of the different model years and engine sizes. The differences are slight and cannot be accurately identified by year, model or casting number. The type and height verification gauge included in the kit makes this simple. It is imperative to use the right installation tools to assure the proper heat range of the spark plug and to avoid pre-ignition.

Comes packaged in a blow molded case.
